2 Graded Questions

1. (4 points) Let $x > 1$. Recall that $x^{\frac{1}{q}}$ is defined for any $q \in \mathbb{N}$, and $x^{\frac{p}{q}} = \left(x^{\frac{1}{q}}\right)^p$ for any $p \in \mathbb{Z}$, $q \in \mathbb{N}$, i.e., x^y is defined for any $y \in \mathbb{Q}$. It is also not hard to see that $x^{y+z} = x^y x^z$ for $y, z \in \mathbb{Q}$.

In this question, you'll prove that the exponential is a valid operation for real numbers and prove some of its properties. For all parts, fix $x > 1$. For $y \in \mathbb{R}$, we define the set

$$E(x, y) = \{x^t \mid t < y, t \in \mathbb{Q}\}.$$

- (a) Suppose that y is rational. Prove that

$$x^y = \sup E(x, y).$$

Hint You may use the fact, which is a consequence of the Density Theorem: for $M \in \mathbb{R}$ satisfying $M < x^y$, there exists $t \in \mathbb{Q}$ such that $M < x^t < x^y$.

- (b) For $y \in \mathbb{R}$ (not necessarily rational), show that $E(x, y)$ is bounded.
(c) Let $x > 1$. For $y \in \mathbb{R}$, we define $x^y = \sup E(x, y)$. Prove that for $y, z \in \mathbb{R}$,

$$x^{y+z} = x^y x^z.$$

Explain why this implies that the function $f : \mathbb{R} \rightarrow \mathbb{R}_{>0}$ given by $f(y) = x^y$ is injective.

Hint To prove $x^{y+z} = x^y x^z$, you may need to show the following property: Let $t \in \mathbb{Q}$ with $t < y + z$. There exist $t_1, t_2 \in \mathbb{Q}$ such that $t = t_1 + t_2$, $t_1 < y$ and $t_2 < z$.

To prove this, you may consider t_1 to be a rational number satisfying $y - \varepsilon < t_1 < y$ where $\varepsilon = y + z - t$. Please fill in the details.

2. (3 points) Let $x > 1$. In this question, you'll prove that the function $f : \mathbb{R} \rightarrow \mathbb{R}_{>0}$ given by $f(y) = x^y$ is invertible. In particular, you should prove that for any $z > 0$ there exists y such that $x^y = z$, i.e., f is surjective. (We write $y = \log_x(z)$.) This proof is tricky, so a rough outline to follow has been provided for you. You should explain each step in the outline in more detail.

Proof Outline:

- (i) For any $n \in \mathbb{N}$, we have $x - 1 \geq n \left(x^{\frac{1}{n}} - 1\right)$.

Hint Use Bernoulli's Inequality.

- (ii) If $t > 1$ and $n \in \mathbb{N}$ such that $n > \frac{x-1}{t-1}$, then $x^{\frac{1}{n}} < t$.

- (iii) If $y \in \mathbb{R}$ is such that $x^y < z$, then there exists $n \in \mathbb{N}$ such that $x^{y+\frac{1}{n}} < z$.
- (iv) If $y \in \mathbb{R}$ is such that $x^y > z$, then there exists $n \in \mathbb{N}$ such that $x^{y-\frac{1}{n}} > z$.
- (v) Define the set $A(z) = \{w \in \mathbb{R} \mid x^w < z\}$. Let $y = \sup A(z)$. Then $x^y = z$.

3. (3 points) Consider the sequence

$$\sqrt{2}, \sqrt{2\sqrt{2}}, \sqrt{2\sqrt{2\sqrt{2}}}, \dots$$

Does it converge or diverge? Prove your claim. Find the limit if you claim that it converges.

- 4. (3 points) Let (x_n) be a monotone sequence. Prove **without using the Monotone Convergence Theorem** that (x_n) has a convergent subsequence if and only if (x_n) is convergent.
- 5. (2 points) Carry out the proof of the previous problem without using the Monotone Convergence Theorem. Use this result to explain how one could use the Bolzano-Weierstrass Theorem to prove a part of the Monotone Convergence Theorem:

A monotone sequence of real numbers is convergent if and only if it is bounded.
