Question 1

Proof. Define a function f as:

$$f : \mathbb{N} \to \{1, 4, 7, 10, 13, \cdots\} : n \mapsto 3n - 2$$

Now we need to show f is *one to one* and *onto*.

- Prove f is *one to one*

  Proof. To prove f is *one to one*, we must show that if $f(n_1) = f(n_2)$, then $n_1 = n_2$.
  Suppose $f(n_1) = f(n_2)$. Then:

  $$3n_1 - 2 = 3n_2 - 2$$

  $$\Rightarrow 3n_1 = 3n_2 \Rightarrow n_1 = n_2$$

  Since $n_1 = n_2$, f is injective. □

- Prove f is *onto*

  Proof. To prove f is *onto*, we need to show for every $m \in \{1, 4, 7, 10, 13, \cdots\}$, there exists an $n \in \mathbb{N}$ s.t. $f(n) = m$.
  Take any $m \in \{1, 4, 7, 10, 13, \cdots\}$. We want to find n such that $3n-2 = m$.
  Solving for n:

  $$3n - 2 = m \Rightarrow 3n = m + 2 \Rightarrow n = \frac{m+2}{3}$$

  Since m is given of the form $3k + 1$ for some integer k. Therefore, $n \in \mathbb{N}$, and f is onto. □

  Since f is *one to one* and *onto*, it is a bijection. Hence, $f(n) = 3n - 2$ is a explicit bijection from the set $\mathbb{N}$ to $\{1, 4, 7, 10, 13, \cdots\}$.

  □

Question 2

Proof. Define a function f as:

$$f : (0,1) \to \mathbb{R}_{>0} : n \mapsto \frac{n}{1-n}$$

Now we need to show f is *one to one* and *onto*.

- Prove f is *one to one*

  Proof. To prove f is *one to one*, we must show that if $f(n_1) = f(n_2)$, then $n_1 = n_2$.
  Suppose $f(n_1) = f(n_2)$. Then:

  $$\frac{n_1}{1-n_1} = \frac{n_2}{1-n_2}$$
  $$\Rightarrow n_1(1-n_2) = n_2(1-n_1)$$
  $$\Rightarrow n_1 - n_1 n_2 = n_2 - n_2 n_1$$
  $$\Rightarrow n_1 = n_2$$

  Thus, f is one to one. $\square$

- Prove f is *onto*

  Proof. To prove f is *onto*, we need to show for every $m \in \mathbb{R}_{>0}$, there exists an $n \in (0,1)$ s.t. $f(n) = m$.
  Take any $m > 0$. We want to find n such that $\frac{n}{1-n} = m$. Solving for n:

  $$n = m(1-n) \Rightarrow n + nm = m \Rightarrow n(1+m) = m \Rightarrow n = \frac{m}{1+m}$$

  Note that $m > 0$, this implies $0 < \frac{m}{1+m} < 1$, hence $n \in (0,1)$.
  Thus, for every $m > 0$, there is an $n \in (0,1)$ s.t. $f(n) = m$. (i.e. f is onto) $\square$

  Since f is *one to one* and *onto*, it is a bijection. Hence, $f(n) = \frac{n}{1-n}$ is a explicit bijection from the set $(0,1)$ to $\mathbb{R}_{>0}$.

  $\square$

Question 3

Proof. Let $n_i \in (0,1)$ s.t. $f(n_i) = i$, modified the function f from Q2 to g as:

$$g : [0,1) \to \mathbb{R}_{>0} : g(n) = \begin{cases} f(n), & \text{if } n \notin \{n_i\}_{i=1}^{\infty},\ n \neq 0 \\ i, & \text{if } n = n_i \text{ for some i} \\ 1, & \text{if } n = 0 \end{cases}$$

Now we need to show g is *one to one* and *onto*.

- Prove g is *one to one*

  Proof. To prove g is *one to one*, we must show that if $g(x_1) = g(x_2)$, then $x_1 = x_2$.
  Case 1: $x_1, x_2 \in (0,1)$:

  - If $x_1, x_2 \notin \{n_i\}_{i=1}^{\infty}$, then $g(x_1) = f(x_1)$ and $g(x_2) = f(x_2)$. Since f is injective, $f(x_1) = f(x_2) \implies x_1 = x_2$
  - If $x_1 = n_i$ for some i and $x_2 = n_j$ for some j, then $g(x_1) = i$ and $g(x_2) = j$. If $g(x_1) = g(x_2)$, then $i = j$, implying $x_1 = n_i = n_j = x_2$.
  - If $x_1 \notin \{n_i\}_{i=1}^{\infty}$ and $x_2 = n_i$ for some i (or vice versa), then $g(x_1) = f(x_1) \neq i = g(x_2)$. Thus, $g(x_1) \neq g(x_2)$. Thus, $g(n_1) \neq g(n_2)$, showing it is one to one.

  Case 2: $x_1 = 0$ and $x_2 \in (0,1)$:
  Note $g(0) = 1$, if $x_2 \in (0,1)$, $g(x_2) \neq 1$ since $f(x) > 1, \forall x \in (0,1)$. Therefore, $g(0) \neq g(x_2)$. □

- Prove g is *onto*

  Proof. To prove g is *onto*, we need to show for every $y \in \mathbb{R}_{>0}$, there exists an $x \in [0,1)$ s.t. $g(x) = y$.
  Case 1: $y = i$ for some $i \in \mathbb{N}$:
  For each $i \in \mathbb{N}$, we have $g(n_i) = i$, ehere $n_i \in (0,1)$. Therefore, for every integer $i \in \mathbb{N}$, we can find some $n_i \in (0,1)$ s.t. $g(n_1) = i$.

  Case 2: $y = 1$:
  For $y = 1$, $g(0) = 1$. $y = 1$ is covered by $x = 0$.

  Case 3: $y \in \mathbb{R}_{>0} \backslash \mathbb{N}$:
  From Q2, since f is a bijection, for every $y \in \mathbb{R}_{>0} \backslash \{i | i \in \mathbb{N}\}$, there exists an $x \in (0,1) \backslash \{n_i\}_{i=1}^{\infty}$ s.t. $f(x) = y$.
  Hence, $g(x)$ covers $\mathbb{R}_{>0}$. (i.e. $g(x)$ is onto.) □

  Since g is *one to one* and *onto*, it is a bijection.

□

Question 4

(a) Show that $g \circ f$ is injective if both of f and g are injective.

Proof. Given that $f : A \to B$ and $g : B \to C$ are injective. We can write $g \circ f$ as $g \circ f : A \to C$, defined as $(g \circ f)(x) = g(f(x))$.
Assume: $(g \circ f)(x) = (g \circ f)(y),$ for some $x, y \in A$,

1. By the definition of composite function, we can get $g(f(x)) = g(f(y))$
2. Given, g is injective, $f(x) = f(y)$
3. Also given, f is injective, $x = y$

Hence, $g \circ f$ is injective. □

(b) Show that $g \circ f$ is surjective if both of f and g are surjective.

Proof. Given that $f : A \to B$ and $g : B \to C$ are surjective. We can write $g \circ f$ as $g \circ f : A \to C$, defined as $(g \circ f)(x) = g(f(x))$.
Let an arbitary value $z \in C$. We need to find some $x \in A$ such that $(g \circ f)(x) = z$

1. Given g is surjective, hence there exists a $y \in B$ such that $g(y) = z$
2. Given f is surjective, hence there exists a $x \in B$ such that $f(x) = y$
3. Hence, $(g \circ f)(x) = g(f(x)) = g(y) = z$

Hence, $g \circ f$ is surjective. □
